What is claimed is:

1. A method of measuring the phase or frequency of a periodic input signal using a periodic reference signal, comprising:

comparing the input signal to the reference signal to obtain a lead signal and a lag signal; and

changing the count of an up/down counter in dependence on the input signal, the reference signal, the lead signal and the lag signal; and

using the lead signal, the lag signal and the count signal to produce a phase or frequency signal, including:

forming from the lead and lag signal a difference signal;

filtering the difference signal to produce a filtered signal; and
adding to the filtered signal a correction signal of a magnitude determined in accordance with the count signal.

- 2. The method of Claim 1, wherein the difference signal is filtered to produce an aliased output signal.
- 3. The method of Claim 2, wherein the aliased output signal has added to it a correction signal representing a positive or negative phase increment to form an unwrapped output signal.

Apparatus for measuring the phase or frequency of a periodic input signal using a periodic reference signal, comprising:

a comparison circuit for comparing the input signal to the reference signal to obtain a lead signal and a lag signal;

a logic circuit, including an up/down counter, responsive to the input signal, the reference signal, the lead signal and the lag signal to change the count of the up/down

counter; and

means for using the lead signal, the lag signal and the count signal to produce a phase or frequency signal, including:

means for forming from the lead and lag signal a difference signal;
means for filtering the difference signal to produce a filtered signal; and
means for adding to the filtered signal a correction signal of a magnitude
determined in accordance with the count signal.

The apparatus of Claims, wherein the means for forming and means for filtering comprise a pulse combiner/filter, and the pulse combiner/filter filters the difference signal to produce an aliased output signal.

The apparatus of Claim, wherein the adder adds to the aliased output signal a correction signal representing a positive or negative phase increment to form an unwrapped output signal.

The apparatus of Claim //, further comprising circuitry for forming the correction signal using the count of the up/down counter.

The apparatus of Claims, wherein the circuitry for forming the correction signal comprises a multiplier having as one input signal a constant value and having as another input signal the count of the up/down counter.
